CONTINUOUS nerve blockade is the only available medium- to long-term modality that blocks evoked pain (e.g. by knee flexion after knee surgery). In addition to the humanitarian and economical aspects of effective pain management, it is not surprising that improved and faster rehabilitation after surgery, such as knee arthroplasty, have been demonstrated. Furthermore, decreased nausea and ...

We will review the evidence surrounding particular strategies to reduce the incidence of peripheral nerve injury during nerve blockade, including nerve localisation methods, timing of blocks, needle techniques and design, injection pressure-monitoring and local anaesthetic and adjunct choice.

Peripheral nerve injury arising in anaesthesia practice

A nerve block is a form of regional anesthesia. Peripheral nerve blocks (PNBs) entail the injection of corticosteroids, local anesthetics, neurolytic agents and/or sclerosing agents into or near peripheral nerves resulting in the temporary interruption of conduction of impulses in peripheral nerves or nerve trunks (somatic and sympathetic nerves).

Clinical Policy Bulletin: Peripheral Nerve Blocks

Similarly, the risk-benefit ratio of analgesic peripheral nerve blocks and fascial plane blocks should be evaluated on a case-by-case basis. If the block is performed under general anaesthesia and requires repositioning of the patient, there is a risk of tracheal tube disconnection or dislodgement.
